"Internet, Law and Politics: A European Perspective"
ISCOR 450/GENS 450/HSEC 797 (3 units)

In the last thirty years, digitally-based information and communication technologies (ICTs) have been introduced into all fields of human activity: culture, economics, education, the media, justice, public services administration and the functioning of the political system. Consequentially, the emergence of such new information and communication technologies has reshaped the way people, businesses, and governments interact. This class is a three-week intensive study of e-commerce, e-governance, digital justice and cyber security. The core component of this class will focus on understanding how ICTs are a considerable driving force behind economic growth, citizen engagement and job creation but may also represent a challenge to our economic, political and justice system.
